Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10.(11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken
BY703373 RIKEN full-length enriched, adult male kidney Mus musculus CDNA clone 0610041A01 5', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DEFINITE GENOME-TESSESCITIKEN.90.jp,

0.9 ug of total RNA, treated with 74 DNA polymerase, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/Chloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/Chloroform and Centricon 100. The CDNAs were digested with Sal1 and NoII enzymes and cloned into Sal1/NoII site of pSPORTI plasmid vector. The DHIUB E. Coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.1 kb. The library was constructed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 K0748C01-5N NIA Mouse Hematopoietic Stem Cell (Lin-/c-Kit-/Sca-1-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the coding sequence for the murine antibody 11D10 heavy chain variable region. This anti-lidicype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumour in an individual having low tumour burden. The antibody 11D10 is used to prevent the recurrence of HMFG-associated tumours e.g. ovarian, non-small cell lung and pancreatic carcinoma, especially for treating breast tumours.
                                                                                                                                                                                                   /*tag= a /*tag= a //product= "antibody 11D10 heavy chain variable region" //note= "no stop codon is given at the 3' end of the sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 ATGGAATGCAGCTGGGTCTTTCTCTTCTCTGTCAATAACTACAGGTGTCCACTCCCAG

                                                                                                                                                                                                                               This cDNA sequence encodes the heavy chain variable region VH (AAWB5150) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line ATCC 12020. 11D10 was obtained by immunising naive mice with MC-10 anti-HMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human milk fat globule (HMFC). It induces an immunological response to HMFG in mice, rabbits, monkeys and patients with advanced HMFG associated tumours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polynucleotides are claimed. Also claimed are allagnostic kits and methods of using 11D10, 11D10 polypeptides and/or 11D10 polynucleotides, including methods of treating HMFG-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for CEA (e.g. 3H1). The method is useful for delaying the development, of or treating HMFG/CEA-associated tumours. The
Use of anti-idiotypic antibodies for human milk fat globules (HMFG)- or carcinoembryonic antigen (CEA)-associated tumor for delaying the development of, or treating a HMFG- or CEA-associated tumor (e.g. breast tumor) in humans.

                                                                           The invention relates to a gene recombinant antibody that has specific reaction with human vascular endothelial growth factor (VEGF) receptor Plt-1. The antibodies are useful for diagnosis and as remedies for diseases due to abnormal neovascularisation such as proliferation or metastasis of solid tumor, arthritis in rheumatoid arthritis, diabetic retinopathy, premature retinopathy and psoriasis.

monocytes and macrophages from haematopoletic stem cells, containing a substance which binds to human vascular endothelial growth factor (VEGF) receptor Fit-1. The invention also includes a method for diagnosing a disease in which the differentiation of monocytes and macrophages is implicated, using the reagent, and an agent for the treatment of diseases implicated, using the method, containing a substance which binds to Fit-1 or a substance which inhibits the signal transduction of Fit-1. Diseases hypersensitivity, malignant tumours and arterioscleorosis.

Mycrosonsitivity, malignant tumours and arterioscleorosis.

Mycrosonsitivity, malignant tumours and arterioscleorosis.

Concoding anti-human Fit-1 monoclonal antibody fragments, and construction of the antibody. The monoclonal antibody is used in the reagent of the invention. PCR primers AMF70255 antibody is used in the reagent of the invention of the antibody by sequences. Protein sequences AMB78878 each in the isolation of the antibody of the antibody is used in the reagent of the invention of the antibody antibody is sequences. Protein sequences AMB78878 each of the antibody of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody by the monoclonal antibody is used in the reagent of the invention of the antibody of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the invention of the antibody is used in the reagent of the antibody is used in the reagent of the antibody

                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a chimaeric molecule comprising the GD3 (ganglioside antigen) binding domain of antibody MB3.6, with any of 3 variable gene sequences, or the PSMA (prostate-specific membrane antigen) binding domain of antibody 3D8, 4D4 and 3E11, with variable gene sequences, the zeta signalling chain of the T cell receptor and an intervening CD8alpha hinge in which cysteine residues have been mutated. The chimaeric molecules expressed in T cells or NK cells or other effector cells are useful in treating patients with cancers expressing the GD3 (MB3.6 derivatives) or PSMA antigen (3D8, 4D4, 3E11 derivatives), and/or together with each other or with heterologous constructs to engage additional stimulatory and functional properties of the effector cells to enhance the antitumour therapeutic efficacy (claimed). They are particularly useful in disorders including melanoma, neuroendocrine constructs and prostate and small cell lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ÷

                                                                                                                                                                                                                                                                                                                                                                                                                                                86
                                                                                                                                      Sequence carries 2H7 VH region of the chimeric immunoglobulin sequence. The antibodies are useful in passive immunisation avoiding negative immune reactions. They are also useful in assaying and in vitro imaging (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 ATGGAATGCAGCTGGGTCTTTCTCTTCCTCTGTCAATAACTACAGGTGTCCACTCCCAG

                                                                                                                                                                                                                                                                                                                                               The present sequence encodes the mouse antibody 2H7 heavy chain variable region. Antibody 2H7 is specific for human B-cell antigen. The antibody sequence was used to construct a chimeric human-mouse antibody. In the course of the invention. The chimeric antibody is expressed in a secretion vector comprising a pelB pectate lyase secretion signal producing a protein such as a chimeric antibody in a bacterial host. that is capable of binding antigen involves modular assembly of
that is capable of binding antigen involves modular assembly of
antibodies through gene cloning and expression of light and heavy
chains. The cloned immunoglobulin gene can be produced by expression in
genetically engineered organisms. The method comprises: (a) expression in
genetically engineered organisms. The method comprises: (a) expression in
genetically engineered organisms. The method comprises: (a) expression
in a bacterial cell, of a first nucleic acid that encodes a bacterial
signal sequence operably linked to either the heavy chain or heavy chain
fragment, and a second nucleic acid that encodes a bacterial signal
sequence operably linked to either the light chain or light chain
fragment, and obtaining the immunoglobulin from the periphasmic space or
culture medium; or (b) operably linking a nucleic acid encoding a
bacterial signal sequence to a nucleic acid encoding the heavy chain
variable region or the light chain variable region or both of the
variable regions, and obtaining the immunoglobulin from the periplasmic
space or culture medium. The bacterial signal sequences bring about the
transport of the heavy chain or heavy chain fragment, and the light chain
con light chain fragment, or the variable regions through the cytoplasmic
membrane of a bacterial cell. The immunoglobulin comprises: (a) a heavy
chain or heavy chain fragment, and a light chain or light chain fragment,
who mashod is useful fragment, and a light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The method is useful for producing genetically engineered antibodies of desired variable region specificity and constant region properties. The method is also useful large scale production of human antibodies. AAH21985 to AAH22082 and AAB98085 to AAB98097 represent sequences used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 40 ATGGGATTCAGCAGGATCTTTCTCTTCCTCTGTCAGTAACTACAGGTGTCCACAG

                                                    A cDNA clone (AAT70868) codes for the heavy chain variable region (AAW16343) of the 2H7 mouse monoclonal antibody, which recognises human B-cell surface antigen Bp35. The sequence was isolated from a 2H7 cell line cDNA library by PCR amplification. The 2H7 light chain variable sequence (AAT60869) has also been isolated. The sequences have been used to construct a human-mouse chimaeric antibody with specificity for the human B-cell antigen. (Updated on 25-WAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                   The present sequence was used in the development of a novel method for the production of an immunoglobulin (1g) fragment capable of binding an antigen. The method comprises culturing an E. coli host that has been transformed with a nucleic acid molecule encoding the 1g fragment, under conditions so that the 1g fragment is produced and secreted. The nucleic acid molecule comprises DNA sequences encoding; (a) pectate lyase secretion signal sequence operably inked to a DNA sequence encoding at least the variable region of an 1g Fd molecule; and (b) pectate lyase secretion signal sequence operably linked to a DNA sequence encoding at least the variable region of an 1g 1ght chain, where (a) and (b) are operably linked to a DNA sequence encoding at least the variable region of an 1g 1ght chain, where (a) and (b) are operably linked to a single prokaryotic promoter to form a dicistronic region of a single prokaryotic promoter to form a dicistronic molecules, e.g. derived from murine monoclonal antibody 2H7 raised gainst human B-cell surface antigen. The invention provides a novel approach for producing genetically engineered antibodies of contents. The cloned Ig gene products can be produced by expression in genetically engineered organisms. The application of specific Ig chains in various organisms provides a solution to the reflicient large scale production of human monoclonal antibodies. The invention also provides a solution to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     252 AGACAGGCCTGGAATGGATTGGAGCTATTTATCCAGGAAATGGTGATACTTGCTACAAT

The present sequence was used in the development of a novel method for the production of an immunoglobulin (1g) fragment capable of binding an antigen. The method comprises culturing an E. coli host that has been transformed with a nucleic acid molecule encoding the. Ig fragment, under conditions so that the Ig fragment is produced and secreted. The nucleic acid molecule comprises DNA sequences concoding: (a) pectate lyase secretion signal sequence operably linked to a DNA sequence encoding at least the variable region of an Ig Fd molecule; and (b) pectate lyase secretion signal sequence operably linked to a DNA sequence encoding at least the variable coperably linked to a DNA sequence encoding at least the variable coperably linked to a DNA sequence and (b) are operably linked to a single prokaryotic promoter to form a dicistronic region of an Ig light chain, where (a) and (b) are operably linked to a single prokaryotic promoter to form a dicistronic conscription unit. The method is used to produce channeric Fab molecules, e.g. derived from murine monoclonal antibody 2H7 raised against human B-cell surface antigen. The invention provides a novel approach for producing genetically engineered antibodies of desired variable region specificity and constant region properties. The cloned Ig gene products can be produced by expression in genetically engineered organisms. The application of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E. coli

chemical gene synthesis, recombinant DNA cloning and production of
                                                                                                                                                                                                                                                                         ;
       specific Ig chains in various organisms provides an effective solution for the efficient large scale production of human monoclonal antibodies. The invention also provides a solution the problem of class switching antibody molecules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         371
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence was used in the development of a novel method for the production of an immunoglobulin (1g) fragment capable of binding an antigen. The method comprises culturing an E. coil host that has been transformed with a nucleic acid molecule encoding the and secreted. The nucleic acid molecule encoding the and secreted. The nucleic acid molecule comprises DNA sequences and secretion is produced and secretion pertably inked to a DNA sequence encoding at least the variable region of an Ig Handle to an DNA sequence encoding at least the variable region of an Ig light chain, where (a) and (b) are operably linked to a Single prokaryotic promoter to form a dicistronic region of an Ig light chain, where (a) and (b) are operably linked to a single prokaryotic promoter to form a dicistronic ranscription unit. The method is used to produce chimeric Fab molecules, e.g. derived from murine monoclonal antibody 2H7 raised against human B-cell surface antipen. The invention provides a covel approach for producing genetically engineered antibodies of estred variable region specificity and constant region properties. The cloned Ig gene products can be produced by chemical gene synthesis, recombinant DNA cloning and production of specific Ig chains in various organisms. The application of specific Ig chains in various organisms provides a solution to monoclonal antibodies. The invention are producted a solution to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 ATGGAATGCAGCTGGGTCTTTCTCTTCCTCTGTCAATAACTACAGGTGTCCACTCCCAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes the heavy chain variable region of the 2H7 antibody. The 2H7 CDNA was used in the preparation of a novel polynucleotide molecule encoding an Ig fragment. The DNA molecule comprises 2 DNA sequences encoding 2 pectate lyase secretion signal sequences respectively linked to a DNA sequence encoding an Ig Fd molecule or Ig light chain, operably linked to a single prokaryotic promoter so as to form a dicistronic transcription unit, provided that the Ig fragment can bind an antigen and is produced and secreted by an E. coli host cell, the nucleic acid molecule is expressed in the host cell.
